

## Unit VIII Project

### Option 1: Creating a Personal Web Application Using ASP.NET

This project provides you with an opportunity to create your own Web application in Visual Basic. Your application should include the following:

- include at least three Web pages,
  - have static text on the Web pages,
  - have titles on the Web pages,
  - have text formatting (h1, h2, center, etc.),
  - have at least one link button control,
  - have at least one image, and
  - include at least one Click event procedure.
1. In a Microsoft Word document, explain the purpose of your Web application by providing a brief description for the task being performed. Then, develop the algorithm using pseudocode (output, input, and algorithm). You can write your algorithm and support it with the use of a flowchart.
  2. Create your Web application by including all the components in the bulleted list above. Save your work in a Visual Basic file, and submit it in Blackboard for grading.
