Project

Finding the Largest Number

Create a program that allows the user to enter sets of integer values, in any order. Per set of data, the program is to output the largest number.

Examples:

1. Given the set of supplied values: (1, -3, 22, -30), the program should display **22**, as the largest value.
2. Given the set of supplied values: (52, 20, -9, 0, 7, 1500, 77, -15), the program should display **1500**, as the largest value.

 Project Requirements: For a **single execution of the program**, the user may enter **multiple sets of data**, and for each set of data the program should find the largest number.
